Week 4: Lists

News: “Social Media Shaming Your College”

- <https://www.nytimes.com/2020/09/10/technology/coronavirus-quarantines-college.html>
- Students are using apps to shame their schools into better coronavirus plans.
- We’ve all seen social media used to shame people we disagree with. Those milliseconds of tsk-tsking might feel good, but I doubt they’re helpful.
- College students are using TikTok, Twitter and other apps to embarrass their universities when they fail to care for people who have been isolated in special Covid-19 dorms or are in quarantine units because of a possible exposure.

Announcements

- This week:
 - Lists, Lists and HOFs on Wednesday
 - Videos are going to try to go a little faster. Let me know if it's not working.
- Practice Problems: Optional for lab 2 because the order was wrong. (Sorry!)
 - Remember, they're required but based on effort.
- Register to vote!
 - Vote.org
 - International Students: You can't donate, but you can volunteer if you'd like. 😊

Computational Structures in Data Science

Lists

Learning Objectives

- Lists are a new data type in Python.
- Lists can store any kind of data and be any length.
- We start counting items of lists at 0.
- Lists are *mutable*. We can change their data!

Lists

- A structure in Python that can hold many elements
 - Also referred to as an “array” in other programming languages.
- Lists are used to group similar items together.
 - A “contact list”, a “list of courses”, a “to do list”
- Python lists are *really* flexible!
 - Can contain any type of data
 - Can mix and match types!
 - Can add and delete items

Types We've Learned So Far

- Each *type* of data has a specific set of functions (methods) you can apply to them, and certain properties you can access.
- ints/Integers
 - 1, -1, 0, ...
- floats (“decimal numbers”)
 - 1.0, 3.14159, 20.0
- strings
 - "Hello", "CS88"
- list/Arrays
 - ['CS88', 'DATA8', 'POLSCI2', 'PHILR1B']
- functions
 - max(), min(), print(), your own functions!

List Operations

- `[]` "square brackets": Used to access items in a list. We start at 0!
- `len()`: The number of items in a list
- `+`: We can add lists together
- `min()`, `max()`: Functions that take in a list and return some info.
- Converting between types: Strings and Lists:
 - `<string>.split(<separator>)` → List of string
 - » `"I am taking CS88.".split(' ')`
 - `<string>.join(<list>)` → String, with the items of a list joined together.
 - » `".join(["I", "am", "taking", "CS88."])`
- Lots more interesting tools!

Lists, For Loops, and Sequences

Learning Objectives

- For Loops are a "generic" way to iterate over data.
- range is a Python function that generates a sequence of numbers.

for statement – iteration control

- Repeat a block of statements for a structured sequence of variable bindings

```
<initialization statements>
```

```
for <variables> in <sequence expression>:
```

```
    <body statements>
```

```
<rest of the program>
```

while statement – iteration control

- Repeat a block of statements until a predicate expression is satisfied

```
<initialization statements>
while <predicate expression>:
    <body statements>

<rest of the program>
```

```
# Equivalent to a for loop:
index = 0
while index < len(my_list)
    item = my_list[index]
    ...
    index += 1
```

range

- `range()` is a built in Python tool that generates a sequence of numbers.
 - It does not return a list unless we explicitly ask for one.
- It has many options: start, stop, and step.
- Range is *lazy*! It can be iterated over, but doesn't compute all its values at once.
 - We'll revisit this later.
- **GOTCHA:** Range is exclusive in the last value!
 - **`range(10)` is a sequence on 10 numbers from 0 to 9.**
- <https://docs.python.org/3.7/library/stdtypes.html?highlight=range#range>

List Comprehensions

Learning Objectives

- List comprehensions let us build lists inline.
- We can easily “filter” the list using a conditional expression.

- describe an expression to perform on each item in a sequence
- let the data dictate the control
- In some ways, nothing more than a concise for loop.

```
[ <expr with loop var> for <loop var> in <sequence expr > ]
```

```
[ <expr with loop var> for <loop var> in <sequence expr >  
if <conditional expression with loop var> ]
```

Control Structures Review

- The result of `list(range(0,10))` is...
-
- **A) [0, 1, 2, 3, 4, 5, 6, 7, 8, 9]**
- **B) [0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10]**
- **C) [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]**
- **D) [1, 2, 3, 4, 5, 6, 7, 8, 9]**
- **E) an error**

- <http://bit.ly/88Lec3Q1>

Solution:

A) `list(range(m,n))` creates a list with elements from m to n-1.

iClicker Question

- What is the value of thing after running:
 - thing = [print('I like '+ course) for course in courses]
 - Nothing
 - ["I like CS88", "I like DATA8", ...]
 - []
 - [None, None, None, None]
 - Error

The result of `len([i for i in range(1,10) if i % 2 == 0])` is...

- A) 5
- B) 4
- C) 3
- D) 2
- E) 1

Solution:

B) `len([2, 4, 6, 8]) == 4`

iClicker Question

```
>>> uni = 'The University of California at Berkeley'  
>>> words = uni.split(' '  
>>> thing = [ w[0] for w in words ]
```

- A) []
- B) ['The', 'University', 'of', 'California', 'at', 'Berkeley']
- C) 'TUoCaB'
- D) ['T', 'U', 'o', 'C', 'a', 'B']
- E) Error

Solution:

D)

Control Structures Review

- The result of `[i for i in range(3,9) if i % 2 == 1]` is...
-
- **A) [3, 4, 5, 6, 7, 8, 9]**
- **B) [3, 4, 5, 6, 7, 8]**
- **C) [1, 3, 5, 7, 9]**
- **D) [3, 5, 7, 9]**
- **E) [3, 5, 7]**
-
- <http://bit.ly/88Lec3Q2>

Solution:

E) [3, 5, 7]
