## Computational Structures in Data Science

### Abstract Data Types

UC Berkeley | Computer Science 68 | Michael Bull | <https://cs68.org>

1

## Announcements

- Midterm scores out in the next couple of days
  - Will have 1 week for regrade requests
- Maps project is out.
  - There's an early "Checkpoint" in 1 week

UC Berkeley | Computer Science 68 | Michael Bull | <https://cs68.org>

2

## Today's Lecture

- Abstract Data Types
  - More use of functions!
  - Value in documentation and clarity
- New Python Data Types
  - Dictionaries, a really useful tool!

UC Berkeley | Computer Science 68 | Michael Bull | <https://cs68.org>

3

## Abstract Data Type

- Uses pure functions to encapsulate some logic as part of a program.
- We rely of built-in types (int, str, list, etc) to build ADTs
- This is a contrast to object-oriented programming
  - Which is coming soon!

UC Berkeley | Computer Science 68 | Michael Bull | <https://cs68.org>

4

## Creating Abstractions

- Compound values combine other values together
  - date: a year, a month, and a day
  - geographic position: latitude and longitude
  - a game board
- Data abstraction lets us manipulate compound values as units
- Isolate two parts of any program that uses data:
  - How data are represented (as parts)
  - How data are manipulated (as units)
- Data abstraction: A methodology by which functions enforce an abstraction barrier between *representation and use*

UC Berkeley | Computer Science 68 | Michael Bull | <https://cs68.org>

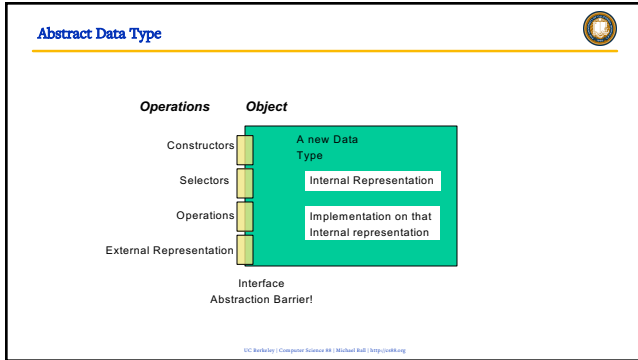

5

## Why Abstract Data Types?

- "Self-Documenting"
  - `contact_name(contact)`
    - » vs `contact[0]`
  - "0" may seem clear now, but what about in a week? 3 months?
- Change your implementation
  - Maybe today it's just a Python List
  - Tomorrow: it could be a file on your computer; a database in web

UC Berkeley | Computer Science 68 | Michael Bull | <https://cs68.org>

7

### Reminder: Lists

- Lists
  - Constructors:
    - » list( ... )
    - » [ <exps>, ... ]
    - » [<exp> for <var> in <list> [ if <exp> ] ]
  - Selectors: <list> [ <index or slice> ]
  - Operations: in, not in, +, \*, len, min, max
    - » Mutable ones too (but not yet)
- » Tuples
  - » A lot like lists, but you cannot edit them. We'll revisit on Monday.

9

### A Small ADT

```
def point(x, y): # constructor
    return [x, y]

x = lambda point: point[0] # selector
y = lambda point: point[1]

def distance(p1, p2): # Operator
    return ((x(p2) - x(p1))**2 + (y(p2) -
y(p1))**2) ** 0.5

origin = point(0, 0)
my_house = point(5, 5)
campus = point(25, 25)
distance_to_campus = distance(my_house, campus)
```

10

### Creating an Abstract Data Type

- Constructors & Selectors
- Operations
  - Express the behavior of objects, invariants, etc
  - Implemented (abstractly) in terms of Constructors and Selectors for the object
- Representation
  - Implement the structure of the object
- An *abstraction barrier violation* occurs when a part of the program that can use the higher level functions uses lower level ones instead
  - At either layer of abstraction
- Abstraction barriers make programs easier to get right, maintain, and modify
  - Few changes when representation changes

At the bottom of the slide, there is a small copyright notice: '© Berkeley | Computer Science 40 | Michael Hall | http://cs40.org'

11

### Question: Changing Representations?

Assuming we update our selectors, what are valid representations for our point(x, y) ADT?

Currently point(1, 2) is represented as [1, 2]

- A) [y, x] # [2, 1]
- B) "X: " + str(x) + " Y: " + str(y)
  - # "X: 1 Y: 2"
- C) str(x) + ' ' + str(y) # '1 2'
- D) All of the above
- E) None of the above

At the bottom of the slide, there is a small copyright notice: '© Berkeley | Computer Science 40 | Michael Hall | http://cs40.org'

12

### A Layered Design Process

- Build the application based entirely on the ADT interface
  - Operations, Constructors and Selectors
- Build the operations in ADT on Constructors and Selectors
  - Not the implementation representation
  - This is the end of the abstraction barrier.
- Build the constructors and selectors on some concrete representation

At the bottom of the slide, there is a small copyright notice: '© Berkeley | Computer Science 40 | Michael Hall | http://cs40.org'

15

### Example: Tic Tac Toe and Phone Book

- See the companion notebook.

16

### Question: The Abstraction Barrier

Which of these violates a board ADT?

- A) `diag_left = diagonal(board, 0)`
- B) `board[0][2] = 'x'`
- C) `all_rows = rows(board)`
- D) `board = empty_board()`
- E) None of the above

17

### A little application

```

phone_book_data = [
    ("Christine Strauch", "510-842-9235"),
    ("Frances Catal Bulosan", "932-567-3241"),
    ("Jack Chow", "617-547-0923"),
    ("Joy De Rosario", "310-912-6483"),
    ("Casey Casem", "415-432-9292"),
    ("Lydia Lu", "707-341-1254")
]

phone_book = pb_create(phone_book_data)
print("Jack Chow's Number: ", pb_get(phone_book, "Jack Chow"))

print("Area codes")
area_codes = list(map(lambda x:x[0:3], pb_numbers(phone_book)))
print(area_codes)
    
```

18

### Dictionaries

- Lists, Tuples, Strings, Range
- Dictionaries
  - Constructors:
    - `dict( <list of 2-tuples> )`
    - `dict( <key>=<val>, ... )` # like kwargs
    - `{ <key exp>:<val exp>, ... }`
    - `{ <key>:<val> for <iteration expression> }`
  - Selectors: `<dict> [ <key> ]`
    - `<dict>.keys()`, `.items()`, `.values()`
    - `<dict>.get(key [, default])`
  - Operations:
    - Key in, not in, len, min, max
    - `<dict>[ <key> ] = <val>`

19

### Dictionary Example

```

In [1]: text = "Once upon a time"
        d = {word: len(word) for word in text.split()}
        d
Out[1]: {'Once': 4, 'a': 1, 'time': 4, 'upon': 4}
In [2]: d['Once']
Out[2]: 4
In [3]: d.items()
Out[3]: [('a', 1), ('time', 4), ('upon', 4), ('Once', 4)]
In [4]: for (k,v) in d.items():
        print(k,">",>v)
        ('a', '> 1)
        ('time', '> 4)
        ('upon', '> 4)
        ('Once', '> 4)
In [5]: d.keys()
Out[5]: ['a', 'time', 'upon', 'Once']
In [6]: d.values()
Out[6]: [1, 4, 4, 4]
    
```

20

### Question: Dictionaries

What is the result of the final expression?

```

my_dict = { 'course': 'CS 88', semester = 'Fall' }
my_dict['semester'] = 'Spring'

my_dict['semester']
    
```

- A) 'Fall'
- B) 'Spring'
- C) Error

21

### Limitations

- Dictionaries are unordered collections of key-value pairs
- Dictionary keys have two restrictions:
  - A key of a dictionary cannot be a list or a dictionary (or any mutable type)
  - Two keys cannot be equal; There can be at most one value for a given key

This first restriction is tied to Python's underlying implementation of dictionaries

The second restriction is part of the dictionary abstraction

If you want to associate multiple values with a key, store them all in a sequence value

UC Berkeley | Computer Science 64 | Michael Hall | http://cs64.org

22

22

### Beware

- **Built-in data type dict relies on mutation**
  - Clobbers the object, rather than "functional" - creating a new one
- **Throws an error if key is not present**
- **We will learn about mutation shortly**

24

24

### Building Apps over KV ADT

```
friend data = [
    ("Christine Strauch", "Jack Chow"),
    ("Christine Strauch", "Lydia Lu"),
    ("Jack Chow", "Christine Strauch"),
    ("Casey Casem", "Christine Strauch"),
    ("Casey Casem", "Jack Chow"),
    ("Casey Casem", "Frances Catal Bulloan"),
    ("Casey Casem", "Joy De Rosario"),
    ("Casey Casem", "Casey Casem"),
    ("Frances Catal Bulloan", "Jack Chow"),
    ("Jack Chow", "Frances Catal Bulloan"),
    ("Joy De Rosario", "Lydia Lu"),
    ("Joy De Lydia", "Jack Chow")
]
```

- **Construct a table of the friend list for each person**

UC Berkeley | Computer Science 64 | Michael Hall | http://cs64.org
