# Computational Structures in Data Science

---

## Data Structures: Trees

## Learning Objectives

---

- Trees are a general version of linked lists
- Trees have a value, and are connected to "sub-trees" called branches
- We can often use recursion to process all items in a tree
  - We typically have recursion inside a loop over all the tree's branches

## Why Learn Trees?

---

- Trees represent lots of natural structures
  - A boss who has employees report to them
  - Courses which belong to departments, and departments which colleges in a University
  - Anything with a hierarchy, really.
    - » A family tree
    - » Biological taxonomies (Kingdom, Phylum....)
    - » Files and Folders

## Review: Linked Lists

---

- A Recursive List, sometimes called a "rlist"
- Linked lists contain other linked lists
- A series of items with two pieces:
  - A value, usually called "first"
  - A "pointer" to the rest of the items in the list.

- We'll use a very small Python class "Link" to model this.

## What is a tree?

- A recursive data structure
  - Almost like a linked list!
- What if a linked list could have multiple “rest” elements?
- We call these “branches”.
- Each branch is also its own Tree.
- 

## Trees are common in Computer Science

---

- Trees give us really cool approaches for “divide and conquer”
  - Used in every computer to speed up searching for files
  - Used for modeling decision systems in AI programs
  - Used for modelling the kinds of moves in a game.
- Another recursive data structure!
  - We can keep practicing recursion and working with classes
  - Computer sciences really like recursion. 😊
- Trees are a simplified form of a *graph*, a tool which can help us model just about anything.

## Searching Trees: Two Strategies

---

- The searching we have been doing today is called “Depth First Search”, or DFS.
- Recursion makes the algorithm very nice.
  - First: we deal with our current item, then we get to the branches.
  - We always make a recursive call on the first branch
  - We continue recursing until there are no more branches
  - Then the function executes, and we go back “up” a level and check out the next branch.
  - We sometimes say: “popping up the stack”.
  - The *stack* is the “stack of function calls” the computer uses to keep track of how things work, and you’ll learn about this in CS61B.

## Searching a Tree by level: Breadth First Search

---

- What if I want to check out all the values of my branches before making a recursive call?
- What if we said, you just can't use recursion. (Sometimes, CS instructors do weird things like that...)
- This is used in practice for lots of cool things:
  - Shortest path between two items (more of a graph and not a tree, usually). Google Maps uses it for routing and the algorithms that power the internet use it.
