Lecture 2:
Abstraction and Functions
Announcements

• Sorry for the confusion in video posting...
  – Only need to watch 1 version.

• https://edstem.org/us/courses/3808/discussion/216190
  – Labs start Wednesday
Computational Structures in Data Science

Abstraction
**Abstraction**

- **Detail removal**
  
  “The act of leaving out of consideration one or more properties of a complex object so as to attend to others.”

- **Generalization**
  
  “The process of formulating general concepts by abstracting common properties of instances”

- **Technical terms:** Compression, Quantization, Clustering, Unsupervised Learning

Henri Matisse “Naked Blue IV”
Experiment

WHERE ARE YOU FROM?
Where are you from?

Possible Answers:
- Planet Earth
- Europe
- California
- The Bay Area
- San Mateo
- 1947 Center Street, Berkeley, CA
- 37.8693° N, 122.2696° W

All correct but different levels of abstraction!
Abstraction gone wrong!
**Detail Removal (in Data Science)**

- You’ll want to look at only the interesting data, leave out the details, zoom in/out...
- Abstraction is the idea that you focus on the essence, the cleanest way to map the messy real world to one you can build
- Experts are often brought in to know what to remove and what to keep!

The London Underground 1928 Map & the 1933 map by Harry Beck.
The Power of Abstraction, Everywhere!

- Examples:
  - Functions (e.g., sin x)
  - Hiring contractors
  - Application Programming Interfaces (APIs)
  - Technology (e.g., cars)

- Amazing things are built when these layers
  - And the abstraction layers are getting deeper by the day!

We only need to worry about the interface, or specification, or contract NOT how (or by whom) it’s built

Above the abstraction line

Abstraction Barrier (Interface)
(the interface, or specification, or contract)

Below the abstraction line

This is where / how / when / by whom it is actually built, which is done according to the interface, specification, or contract.
Abstraction: Pitfalls

• Abstraction is not universal without loss of information (mathematically provable). This means, in the end, the complexity can only be “moved around”

• Abstraction makes us forget how things actually work and can therefore hide bias. Example: AI and hiring decisions.

• Abstraction makes things special and that creates dependencies. Dependencies grow longer and longer over time and can become unmanageable.
**Algorithm**

- An algorithm (pronounced AL-go-rith-um) is a procedure or formula to solve a problem.

- An algorithm is a sequence of instructions to change the state of a system. For example: A computer’s memory, your brain (math), or the ingredients to prepare food (cooking recipe).

Think Data 8: Change or retrieve the content of a table.
Algorithm: Properties

• An algorithm is a description that can be expressed within a finite amount of space and time.
• Executing the algorithm may take infinite space and/or time, e.g. "calculate all prime numbers".
• In CS and math, we prefer to use well-defined formal languages for defining an algorithm.

$6 \div 2(1+2) = ?$

Algorithm: Well-Definition
Algorithms Early In Life (1st Grade)

operator + operands

1 carry (MSD)

7
8

least significant digit of result

5
Algorithms Early In Life (In Binary)

\[
\begin{array}{cccc}
\text{operator} & + & \text{operands} & \text{LSB result} \\
1 & 1 & 1 & 1 & 0 & 0 \\
1 & 1 & 1 & 0 & 0 \\
\hline
1 & 1 & 0 & 1 & 0 \\
\end{array}
\]

\begin{align*}
\text{carry (MSD)} & = 0 \\
\text{14} & + 12 \\
\text{26} &
\end{align*}
More Terminology (Intuitive)

Code
A sequence of symbols used for communication between systems (brains, computers, brain-to-computer)

Data
Observations

Information
Reduction of uncertainty in a model (measured in bits)

Data or Code?

Here is some information!

Integer

Instruction

String
Data or Code? Abstraction!

Human-readable code (programming language)

```python
def add5(x):
    return x+5
def dotwrite(ast):
    nodename = getNodeName()
    label = symbol.sym_name.get(int(ast[0]), ast[0])
    print '%s %s' % (nodename, label),
    if isinstance(ast[1], str):
        if ast[1].strip():
            print '=' %s';' % ast[1]
        else:
            print ''
    else:
        print ''
    children = []
    for n, child in enumerate(ast[1]):
        children.append(dotwrite(child))
    print '%s -> {%s}' % nodename,
    for name in children:
        print '%s' % name,
```

Machine-executable instructions (byte code)

Compiler or Interpreter

Here: Python
Code or GUI: More Abstraction!

- Big Idea: Layers of Abstraction
  - The GUI look and feel is built out of files, directories, system code, etc.
Review:

• Abstraction:
  – Detail Removal or Generalizations

• Code:
  – Is an abstraction!
  – Can be instructions or information

Computer Science is the study of abstraction
Computational Structures in Data Science

Python: Statements and Functions
Learning Objectives

• Evaluate Python Expressions
• Call Functions in Python
• Assign data to Variables
Let’s talk Python

• Expression
  
  \[3.1 \times 2.6\]

• Call expression
  
  \[\text{max}(0, \ x)\]

• Variables
  
  \[\text{my}_\text{name}\]

• Assignment Statement
  
  \[x = \text{<expression>}\]

• Define Statement:
  
  \[\text{def} \ <\text{function name}> (\ <\text{argument list}> \ ) :\]

• Control Statements:
  
  if ...
  for ...
  while ...
  list comprehension
Python: Definitions and Control
Learning Objectives

• Create your own functions.
• Use if and else to control the flow of code.
Conditional Statement

- Do some statements, conditional on a predicate expression

```python
if <predicate>:
    <true statements>
else:
    <false statements>
```

- Example:

```python
if (temperature>37.2):
    print("fever!")
else:
    print("no fever")
```
Defining Functions

- Abstracts an expression or set of statements to apply to lots of instances of the problem
- A function should *do one thing well*

```
def <function name> (<argument list>) :
  expression
  return
```
Functions: Example

```
def max(x, y):
    return x if x > y else y
```

\[
x = 3 \\
y = 4 + \max(17, x+6) \times 0.1 \\
z = x / y
\]
How to Write a Good Function

• Give a descriptive name
  – Function names should be lowercase. If necessary, separate words by underscores to improve readability. Names are extremely suggestive!

• Chose meaningful parameter names
  – Again, names are extremely suggestive.

• Write the docstring to explain *what* it does
  – What does the function return? What are corner cases for parameters?
    
    Python Style Guide: https://www.python.org/dev/peps/pep-0008

• Write doctest to show what it should do
  – Before you write the implementation.
Computational Structures in Data Science

Functions and Environments
def max(x, y):
    return x if x > y else y

x = 3
y = 4 + max(17, x + 6) * 0.1
z = x / y
Computational Structures in Data Science

Iteration With While Loops
Learning Objectives

• Write functions that call functions
• Learn How to use while loops.
while Statement – Iteration Control

• Repeat a block of statements until a predicate expression is satisfied

<initialization statements>
while <predicate expression>:
  <body statements>
<rest of the program>
